1 | Introduction

1.1. Purpose

Finding the right company in which to carry out internships is an issue that a lot of students must handle, both to complete their university carrier and to firstly approach the workplace environment. Unfortunately, it is not always easy for students to find a company whose projects and activities match their interests and skills, especially when the number of available opportunities is high. From another point of view, companies must deal every day with the selection of CVs, basing on students' attitudes and experiences, in order to find suitable figures for the activities they offer.

Students&Companies (S&C) is a platform that helps the matching between university students looking for internships and companies that offer these opportunities. The main idea is that students can publish their CV on the platform to find internships that might interest them, while companies advertise their internships so that the system can help them find suitable students. Companies can also set up and plan interviews with the matching students through the S&C platform, which helps them in the selection process by collecting and analyzing students' answers through structured questionnaires. S&C enables also the interested parts to monitor, keep track and provide information about the execution of the matchmaking processes and the status of the related internships. The main goals of the platform are listed in the following section.

1.1.1. Goals

[G1] Students want to look for available internships that might interest them.

[G2] Companies would like to look for suitable students' CVs for the internships they offer.

[G3] Companies would like to admit suitable students to their internships through interviews and structured questionnaires.

[G4] Both students and companies would like to provide information to the other party

regarding the matchmaking process and the related internships (such as feedback, suggestions or complaints).

1.2. Scope

In this section, we will identify and describe S&C platform **domain**, by specifying world and shared phenomena. The two main involved actors are students and companies.

Students can upload their CV on the platform and can both search for available internships and explore the ones recommended by the system. They can initiate the matchmaking process by selecting an internship of their interest and they can also conclude it by choosing one for which a company has selected their CV. After a match is completed, students undergo an interview with the company and fill out a structured questionnaire to help the company reason about their selection. If they are admitted, students carry out an internship with the matching company and can communicate with it, providing feedback, suggestions and complaints regarding the matchmaking process or the status of the ongoing program.

Companies can advertise their internship offers on the platform and can view uploaded student CVs that are recommended by the system. Symmetrically, they can initiate the matchmaking process for a specific internship by selecting a CV that corresponds to their needs, and they can also conclude it by choosing a student that has previously showed interest in that internship. Companies then use the platform to set up interviews with matching students and to create structured questionnaires for them, so that the system can grade and rank students to facilitate the selection process. Lastly, based on what they have achieved in the previous step, companies can decide to admit or reject matching students for the internship programs. Similarly to students, companies are also able to communicate with those of them who are enrolled for their internships.

1.2.1. World Phenomena

[WP1] A student creates a CV containing their experiences, skills and attitudes.

[WP2] A company defines an internship by creating a document containing related projects and terms.

[WP3] A company interviews a student for an internship using an external virtual meeting platform.

[WP4] A student carries out an internship with the company that admitted them.

[WP5] A company schedules a virtual meeting for an interview using an external platform, obtaining a web link for it.

1.2.2. Shared Phenomena

World Controlled

[SP1] A student uploads their CV on the platform.

[SP2] A student removes their CV from the platform.

[SP3] A student selects an internship of their interest.

[SP4] A student is notified when a company selects their CV.

[SP5] A student is notified when an interview with them has been programmed by a company for an internship.

[SP6] A student is notified when a questionnaire for the selection process of an internship has been uploaded by the corresponding company.

[SP7] A student fills out a questionnaire for the selection process of an internship.

[SP8] A student is notified when a company admits them (or rejects them) after the selection process for an internship.

[SP9] A student provides feedback about an internship and its matching process to the corresponding company.

[SP10] A student fills out a satisfaction questionnaire for an internship or its matching process.

[SP11] A company publishes an internship on the platform by uploading the related document.

[SP12] A company remove an internship (i.e. and the related document) from the platform.

[SP13] A company selects a student CV that corresponds to its needs.

[SP14] A company is notified when a student selects one of its internships.

[SP15] A company sets up an interview with a student for one of its internships.

[SP16] A company creates a questionnaire for the selection process of the students for one of its internships using the platform.

[SP17] A company is notified when a student fills out the questionnaire for the selection process of one of its internships.

[SP18] A company admits a student for an internship after its selection process.

[SP19] A company rejects a student for an internship after its selection process.

[SP20] A company provides feedback about an internship and its matching process to the corresponding student.

[SP21] A company fills out a satisfaction questionnaire for an internship or its matching process with a student.

[SP22] After a company set up an interview with a student, the system adds the interview to both student's and company's calendars.

Machine Controlled

[SP23] The system recommends an internship to a student.

[SP24] The system notifies a student of a new available satisfaction questionnaire about an internship or its matching process.

[SP25] The system recommends a student CV to a company for one of its internships.

[SP26] The system notifies a company of a new available satisfaction questionnaire about an internship or its matching process with a student.

[SP27] The system evaluates a questionnaire of a student for their selection process for an internship, making the grade available to the corresponding company.

1.3. Definitions, Acronyms, Abbreviations

1.3.1. Definitions

- **Users:** they include both students and companies.
- **Matchmaking process:** phase in which students and companies show interest for each other in the context of an internship, possibly basing on system recommendations.
- **Selection process:** phase in which companies decide the students to admit for their internships, basing on interviews and questionnaires outcomes.
- **Credentials:** user e-mail address and password.

1.3.2. Acronyms

- **S&C:** Students&Companies.

1.3.3. Abbreviations

- **G*:** goal number *.
- **WP*:** world phenomenon number *.
- **SP*:** shared phenomenon number *.
- **R*:** functional requirement number *.
- **UC*:** use case number *.

1.4. Revision Hystory

Versions of the document.

1.5. Reference Documents

This document is mainly based on the following materials:

- RASD and DD assignment specification for the Software Engineering 2 course, a.y. 2024-2025.
- Slides of the Software Engineering 2 course, available on WeBeep.

1.6. Document Structure

To provide a better understanding of the document, we report its chapter division below:

1. **Introduction:** it briefly presents the project, describing the goals to be achieved and the main phenomena of the domain. It also provides some useful details for the understanding of the document.
2. **Overall Description:** it includes some possible scenarios and further information about the domain. It also illustrates the main functionalities of the platform, as well as made assumptions.
3. **Specific Requirements:** it contains a comprehensive analysis of both functional and non functional requirements, in addition to constraints relevant attributes of

the system.

4. **Formal Analysis Using Alloy:** it describes the formal modeling activity performed using the Alloy tool.
5. **Effort Spent:** it shows the time spent by each team member for the fulfillment of the project.
6. **References:** here additional references to the main mentioned above are listed.

2 | Overall Description

2.1. Product Perspective

2.1.1. Scenarios

Student uploads a CV

Bob is a Computer Science and Engineering student, and he wants to carry out an internship in order to conclude his university carrier. Bob opens the S&C website and registers as “Student”, providing his personal information (complete name, gender, date and place of birth, address and name of the university in which he’s enrolled), his personal e-mail and a password; after registration, he logs-in to the platform with the same e-mail and password. Once in the S&C homepage, Bob goes to the section “Upload new CV”, attaches his personal CV document and confirms its upload on the platform.

Company publishes an internship document

TechForma Engineering S.R.L. (TF) is a company that wants to advertise a new internship offer in the field of Software Engineering (Int1), in order to find suitable university students to carry it out. TF’s Recruiter Alice opens the S&C website and registers as “Company”, providing some identification information (name of the company, type of business, name of the authorized representative, business registration number and address of the headquarter), the e-mail address of the Recruiting Department and a password; after registration, she logs-in to the platform with the same e-mail and password. Once in the S&C homepage, Alice goes to the section “Publish new internship” and attaches a document containing a detailed description of the projects involved in the internship and its related terms, such as possible future job opportunities and wage. Lastly, Alice confirms the publication of the document on the platform; as a consequence, the system creates a section “Int1” in TF’s homepage.

Student selects a recommended internship

Student Bob, who has a profile on the S&C website and has already uploaded his CV, wants to find an internship offer that could interest him and that possibly aligns with his university carrier. He logs-in to the platform with his credentials and goes to the section “Recommended internships”, where he can view a list of available offers recommended by the system with their related documents. Bob reads the description document for Int1 and, since the related projects interest him, he selects it. As a consequence, the system shows the chosen internship in the section “Selected internships” of Bob’s S&C homepage and notifies the company TF about Bob’s selection, additionally showing Bob’s CV in the subsection “Interested students” of the section “Int1” in TF’s homepage.

Company selects a recommended CV

TF’s Recruiter Alice, which has registered the company on the website and has already published some internships on the platform (including Int1), wants to find suitable students to admit to Int1. She logs-in to the platform with TF’s credentials and, once entered the section dedicated to that internship, she goes to the section “Recommended students”, where she can view a list of students’ CVs recommended by the system. Alice reads Bob’s CV and decides to consider him for an interview, so she selects the CV. As a consequence, the system shows the chosen CV in the section “Selected students” for Int1 and notifies Bob about Alice’s selection, additionally showing the description document for Int1 in the section “Interested companies” of Bob’s homepage.

Student completes the matchmaking process

Student Bob wants to check if any company has shown interest in his CV for an internship offer. He enters the section “Interested companies” of his S&C homepage, where it’s shown that company TF has selected his CV for Int1. Bob reads the description document of the internship and decides to select it, completing the matchmaking process. As a consequence, the system notifies TF about the created match and shows Bob’s CV in the section “Completed matches” for Int1. In addition, also Bob can now view Int1 in the “Completed matches” section of his S&C homepage.

Company completes matchmaking process

TF’s Recruiter Alice wants to check if any student has shown interest in the company’s offer for Int1. She enters the section dedicated to that internship on TF’s homepage and goes into the subsection “Interested students”, in which is shown that Bob has selected their internship. Alice reads Bob’s CV and decides to select it, completing the match-

making process. As a consequence, the system notifies Bob about the created match and shows all the information regarding Int1 in the section “Completed matches” of his homepage. In addition, the system adds Bob’s CV and related information in the corresponding “Completed matches” section for Int1, in TF’s homepage.

Users fill out the satisfaction questionnaires regarding the matchmaking process

TF’s Recruiter Alice enters the section dedicated to Int1 and goes into the subsection “Completed matches”, where for each completed match with a student it is shown the CV of the student, the date in which the match was concluded and a satisfaction questionnaire created by the system (only if this has not been filled out yet). Alice provides her opinion about the matchmaking process with student Bob by filling out the related questionnaire and submits it. In a second moment, Bob repeats the same process by filling out and submitting the satisfaction questionnaire related to the matchmaking process with Int1. After both questionnaires have been submitted, the system evaluates positively or negatively the related match based on users’ responses, in order to feed statistical analysis for future recommendation processes.

Company sets up an interview with a student

The scheduled period for Int1 is approaching and company TF needs to decide which students to admit. Alice enters the section dedicated to Int1, goes to the subsection “Completed matches” and starts the selection process by considering student Bob; therefore, she clicks the button “Set-up interview” related to the match with Bob. Alice fills in a form providing all the information needed to set up the interview, which are date and time of the meeting (04/07/2024 11:00 a.m.) and the link to a previously created virtual meeting on an external platform. After that, the system allows Alice to create a structured questionnaire to collect and evaluate Bob’s answers, as a complementary mechanism for the selection process. Alice creates the questionnaire by defining the questions for Bob, the possible answers and a different score for each answer; after that, she confirms its generation and also the set-up of the interview. As a consequence, the system shows the programmed meeting in the “Interview calendar” section of TF’s homepage, by attaching to the corresponding date the link for the meeting, the time and some of Bob’s personal information. Lastly, the system notifies Bob of the programmed interview and of the available questionnaire.

Student fills out a questionnaire for the selection process

Bob receives a notification by the system informing him that company TF has set-up an interview and created a questionnaire for the selection process of Int1. Bob logs in to the platform with his credentials and enters the “Interview calendar” section located in his homepage, where he can see a new programmed meeting for 04/07/2024 at 11:00 a.m. and the related questionnaire; therefore, Bob fills out the questionnaire and submits it. As a consequence, the system evaluates Bob’s answers with a grade and updates the suitability rank in the “Completed matches” section for Int1 in TF’s homepage with the calculated grade; the system also notifies company TF about this action.

Company admits a student for an internship

After interviewing all the matching students for Int1, company TF wants to admit those of them who look more suitable. Alice enters the section dedicated to Int1 and goes to the subsection “Completed matches”. Based on the high position of Bob in the suitability rank and on the positive outcome of his interview, Alice decides to admit him by clicking the button “Admit” associated to Bob in the rank. As a consequence, the system notifies Bob about his admission and adds in the section “Active internships” of his homepage an entry dedicated to the new ongoing internship, with information about the date of enrollment, some of TF’s identification data, the description document of Int1 and a satisfaction questionnaire (created by the system). Vice versa, Alice enters the subsection “Enrolled students” of section “Int1” and can now view a new line dedicated to Bob’s ongoing internship, with attached information regarding the date of enrollment, Bob’s CV and satisfaction questionnaire created by the system.

Users fill out the satisfaction questionnaires regarding an internship

After ending his internship project with company TF, Bob logs in to the platform with his credentials, enters the section “Active internships” and opens the satisfaction questionnaire related to Int1, where he expresses his positive opinion on the pathway by answering the specific questions generated by the system. In a second moment, Alice repeats the same process by filling out and submitting the satisfaction questionnaire related to the internship experience with Bob. After both questionnaires have been submitted, the system evaluates positively the progress of Int1, in order to feed statistical analysis for future recommendation processes.

Student communicates with a company

Bob is currently working on a project included in Int1 and is encountering difficulties in understanding a task specification in the internship document. Therefore, Bob logs in to the S&C website with his credentials and enters the “Messaging” section of his homepage, where for each active internship the system provides a mechanism to communicate with the corresponding company. Bob opens the messaging session with company TF related to Int1 and complains about ambiguities in the description of that specific task; the system then notifies the company about the student’s message. After receiving the message, Bob’s tutor Carl logs in to the platform with the company’s credentials, enters the section dedicated to Int1 and goes into the “Messaging” subsection, where for each student carrying out the internship the system provides a mechanism to communicate with them. Carl reads Bob’s complaint and answers to his message by clarifying the task’s specification. Bob is then notified about the company’s response, so he reads the clarification (with the same described process) and can continue to work on the project.

2.1.2. Domain Class Diagram

Figure 2.1: Domain Class Diagram

In Figure 2.1 you can find the domain class diagram of the application. As mentioned in the previous sections, the two main users of the system are students and companies. Students can select zero or many internships of their interest, while companies can select zero or many CVs for each of their offers. A match is created when a student and a company mutually select each other within the scope of an internship, therefore it associates a student CV with a specific internship. Companies can set up multiple interviews, one for each of their completed matches, and can do the same for the structured questionnaires that help them in the selection process (SelectionQuestionnaires). Symmetrically, students can fill out different questionnaires of this kind, one for each of their completed

matches. An active internship is created every time that a company admits one of their matching students for an internship. In this context, users can send/receive zero or more messages to/from the other party. Lastly, for each completed match and for each active internship, exactly two satisfaction questionnaires are available to be filled out by the involved student and company.

2.1.3. State Diagrams

Student process

Figure 2.2: Student process

In Figure 2.2, the general process involving a registered student is shown, starting from the CV upload and ending with the carrying out of an internship. Note that the diagram describes just one matchmaking process, while a student can actually select/carry out multiple internships and create more matches simultaneously.

Company process

Figure 2.3: Company process

In Figure 2.3, the general process involving a registered company is shown, starting from the internship publication and ending with its activation for a specific student. Note that the diagram describes just one matchmaking process, while a company can actually publish different internships, select multiple CVs and create more matches simultaneously.

Satisfaction questionnaire

Figure 2.4: Satisfaction questionnaire

Selection process questionnaire

Figure 2.5: Selection process questionnaire

2.2. Product Functions

Sign up, log in, log out

When registering to the platform, users can decide to do that either as students or as companies, providing different kind of information, including their new credentials (email address and password). Once the system has checked that users with the same unique fields do not exist (such as email, registration number for companies, etc.), provided information is saved and the new user is from now on able to log in to the platform through their credentials. At any time when logged in, users are able to log out from the platform as well.

CV upload and internship publication

Once successfully registered and logged in, students can upload their CV, as a document containing their skills, attitudes and experiences, from the designated section. At any time, students can also remove their CV, and possibly substitute it with an updated version. Symmetrically, companies can publish their internships, as documents containing a detailed description of related projects and terms, from the designated section. Just like students with CVs, companies can remove their internship documents at any time and replace them.

Matchmaking process

During this phase, both students and companies can initiate the process by selecting either an internship (for students) or a CV for an internship (for companies) among the

available (and possibly recommended) ones, showing interest for the other part which is notified from the system. Once that happened, the notified actor can show mutual interest accepting the internship (students) or the CV (companies). If that happens, the other party is notified and a match is created. The system now enables the selection process tools for the company.

Selection process

During this phase, companies can decide which matching students to admit to their internships through the help of the system. They can set up interviews held on external platforms (such as Google Meet, Zooms, etc.), providing scheduling information, and create structured questionnaires to be filled out by students. Both students and companies are notified of other party's actions during this process, and at the end of the latter, companies decide whether to admit or reject students basing on their impression of them and on the grades of the questionnaires, which are automatically computed by the system. In case of admission, the internship is activated.

Student-Company communication

Once an internship is activated, both the involved student and company can provide information to the other party about the status of the ongoing internship, such as general feedback, suggestions or complaints. This is allowed by the system through a designated section, where both students and companies can also see what the other party has written.

Recommendation

This functionality allows both students and companies to look among internships and CVs that could interest them or correspond to their needs more than others. To achieve this, the system is able to recommend internships and CVs through different mechanisms. The first one is a straightforward keyword matching between such documents. On the other hand, the second one includes also statistical analysis based on satisfaction questionnaires provided to both students and companies about completed matches and active internships. The system is able to give a Boolean evaluation (positive or negative) to such questionnaires, and at the same time to associate similar students and internships (through keyword matching between their CVs and documents). In this way, the system can recommend to students internships similar to the ones positively evaluated by similar students. Symmetrically, recommended CVs for companies are determined following the same logic.

2.3. User Characteristics

As the name tells, the two main classes of users of S&C are students and companies. The distinction between them is achieved during the registration to the platform.

Students are the ones looking for internships to carry out: after uploading a CV, they can initiate the matchmaking process by selecting an internship, or wait for a company to select their CV. They are the ones who undergo the selection process, and, as well as companies, they can communicate with them once internships are active.

On the other hand, **companies** are the ones looking for students to carry out their internships: after publishing one, they can initiate the matchmaking process by selecting a CV, or wait for students to show interest in their internships. The selection process is meant for them to admit suitable students.

Additionally, both students and companies are questioned by the system to feed statistical analysis for future recommendations through satisfaction questionnaires.

2.4. Assumptions, Dependencies and Constraints

Assumptions, dependencies and constraints.

2.4.1. Domain Assumptions

The following assumptions are facts that the system cannot check and has to take for granted in order to ensure the correct and expected behavior of the platform.

[D1] Students' information contained in their published CVs must be correct.

[D2] Students must remove their uploaded CVs if these are obsolete or contain incorrect information.

[D3] For each company, internships' information (such as projects and terms) contained in the related published documents must be correct.

[D4] Companies must remove their published internships' documents if these are obsolete or if the related internships are no longer available.

[D5] Users must have a reliable internet connection.

[D6] Companies must be able to create a virtual meeting for an interview and to provide the related link to the system.

[D7] For each of their active internships, users must fill out the satisfaction questionnaire provided by the system with correct and coherent information.

[D8] For each of their completed matchmaking processes, users must fill out the satisfaction questionnaire provided by the system with correct and coherent information.

3 | Specific Requirements

3.1. External Interface Requirements

3.1.1. User Interfaces

Mocks of the main user interfaces.

3.1.2. Hardware Interfaces

Hardware interfaces.

3.1.3. Software Interfaces

Software interfaces.

3.1.4. Communication Interfaces

Communication interfaces.

3.2. Functional Requirements

Sign up, log in, log out

[R1] The system should allow new users (i.e. they are not registered yet) to register as students by providing their personal information, a valid email address and a password.

[R2] The system should allow new users (i.e. they are not registered yet) to register as companies by providing company identification information, a valid email address and a password.

[R3] The system should allow registered users to log in using their email address and password.

[R4] The system should allow all logged in users to log out from the platform.

Students

[R5] The system should allow students to upload their CV on the platform only if a CV of that student is not currently uploaded.

[R6] The system should allow students to remove their uploaded CV from the platform¹.

[R7] The system should allow students to look among all available internships (and related document) published by companies on the platform.

[R8] The system should allow students to look among internships (and related document) that are recommended by the platform.

[R9] The system should allow students to select one or more internships of their interest among the available ones (i.e. students start the matching process showing interest for the internship).

[R10] The system should notify students whenever a new recommended internship has been published on the platform by a company.

[R11] The system should notify students whenever a company, whose internship has been selected by that student (i.e. the student initiated the process), has accepted their CV for the selection process regarding that internship.

[R12] The system should notify students whenever a company selects their CV for an internship (i.e. the company initiates the process showing interest for a student CV).

[R13] The system should allow students to accept an internship whose company selected their CV for that internship (i.e. students end the matching process, the selection process starts).

[R14] The system should notify students whenever an interview for one of their matching internships has been programmed by a company.

[R15] The system should allow students to see their programmed interviews on a calendar.

[R16] The system should notify students whenever a questionnaire for one of their matching internships has been uploaded by a company.

[R17] The system should allow students to fill out available questionnaires for their matching internships.

¹The modification of a CV can be obtained by combining R5 and R6.

[R18] The system should notify students when they are admitted to a matching internship after their interview with the company.

[R19] The system should notify students when they are rejected for a matching internship after their interview with the company.

[R20] The system should allow students to provide information to the other party about their active internships (such as complaints, problems or feedback).

[R21] The system should allow students to see information (such as complaints, problems or feedback) provided by the corresponding company for each of their active internships.

[R22] The system should notify students whenever a satisfaction questionnaire regarding an active internship or a matching process is available.

[R23] The system should allow students to fill out available satisfaction questionnaires.

Companies

[R24] The system should allow companies to publish their internships on the platform by providing a document containing information about projects and terms of the internship.

[R25] The system should allow companies to remove previously published internships from the platform².

[R26] For each of their internships, the system should allow companies to look among available students' CVs recommended by the platform.

[R27] For each of their internships, the system should allow companies to select one or more CVs among the recommended ones (i.e. the company initiates the matching process showing interest for a CV).

[R28] The system should notify companies whenever a new recommended CV for one of their internships has been uploaded by a student.

[R29] The system should notify companies whenever a student, whose CV has been selected by that company for a specific internship (i.e. the company initiated the matching process), has accepted that internship (i.e. the selection process starts).

[R30] The system should notify companies whenever a student selects one of their internships (i.e. the student initiates the matching process showing interest).

[R31] The system should allow companies to accept a CV of a student that selected one of their internships (i.e. companies end the matching process, starting the selection process).

²The modification of an internship can be obtained by combining R24 and R25.

[R32] For each of their internships, the system should allow companies to set up an interview with a matching student (for that internship), providing date, time and a web link for the meeting.

[R33] The system should allow companies to see their programmed interviews on a calendar.

[R34] For each of their internships, the system should allow companies to create structured questionnaires for the selection process of matching students.

[R35] The system should allow companies to upload created questionnaires, making them available for the matching students.

[R36] The system should notify companies whenever a matching student filled out the questionnaire for the selection process regarding one of their internships.

[R37] For each of their internships, the system should allow companies to see the results of the selection process questionnaires filled out by matching students ordered by grade.

[R38] For each of their internships, the system should allow companies to admit one or more interviewed matching students (i.e. the internship is now active).

[R39] For each of their internships, the system should allow companies to reject one or more interviewed matching students.

[R40] For each student carrying out an internship with them, the system should allow companies to provide information about that internship (such as complaints, problems or feedback).

[R41] For each of their active internships, the system should allow companies to see information (such as complaints, problems or feedback) provided by each student.

[R42] The system should notify companies whenever a satisfaction questionnaire regarding an internship or a matching process is available.

[R43] The system should allow companies to fill out available satisfaction questionnaires.

System

[R44] The system should be able to evaluate with a grade selection process questionnaires filled out by students.

[R45] As soon as an internship is activated, the system should provide the involved student and company with a satisfaction questionnaire in order to collect statistical information about that internship (such as feedback and suggestions).

[R46] As soon as a student and company match, the system should provide both with a satisfaction questionnaire in order to collect information about the related matching process (such as feedback and suggestions).

[R47] The system should be able to recommend published internships to the students by matching keywords between their CVs and the internships' documents.

[R48] For each internship, the system should be able to recommend to the corresponding company available students' CVs by matching keywords between those and the internship document.

[R49] The system should be able to evaluate (positively or negatively) a completed match between a student and an internship offered by a company by analyzing the satisfaction questionnaires filled out by both parties.

[R50] The system should be able to associate students' CVs to similar ones involved in past completed matches (with internships) by keyword matching among CVs.

[R51] The system should be able to associate internships to similar ones involved in past completed matches (with students' CVs) by keyword matching among internships' documents.

[R52] The system should be able to recommend to students internships similar (i.e. associated as in R51) to ones whose completed matching with similar (i.e. associated as in R50) students was positively evaluated.

[R53] For each internship, the system should be able to recommend to the corresponding company students' CVs similar (i.e. associated as in R50) to ones whose completed matching with similar (i.e. associated as in R51) internships was positively evaluated.

3.2.1. Use Cases Diagram

Use cases diagram.

3.2.2. Use Cases

Use cases.

3.2.3. Sequence Diagrams

Sequence diagrams.

3.2.4. Requirements Mapping

The following tables (3.1, 3.2, 3.3, 3.4) show the mapping of functional requirements and domain assumptions needed to fulfill the goals.

[G1] Students want to look for available internships that might interest them	
R1, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12, R13, R22, R23, R24, R25, R42, R43, R45, R46, R47, R48, R49, R50, R51, R52, R53	D1, D2, D3, D4, D5, D7, D8

Table 3.1: Requirement and domain assumption mapping for G1

[G2] Companies would like to look for suitable students' CVs for the internships they offer	
R2, R3, R4, R5, R6, R22, R23, R24, R25, R26, R27, R28, R29, R30, R31, R42, R43, R45, R46, R47, R48, R49, R50, R51, R52, R53	D1, D2, D3, D4, D5, D7, D8

Table 3.2: Requirement and domain assumption mapping for G2

[G3] Companies would like to admit suitable students to their internships through interviews and structured questionnaires	
R2, R3, R4, R14, R15, R16, R17, R18, R18, R32, R33, R34, R35, R36, R37, R38, R39, R44	D5, D6

Table 3.3: Requirement and domain assumption mapping for G3

[G4] Both students and companies would like to provide information to the other party regarding the matchmaking process and the related internships (such as feedback, suggestions or complaints)	
R1, R2, R3, R4, R20, R21, R40, R41	D5

Table 3.4: Requirement and domain assumption mapping for G4

3.3. Performance Requirements

Performance requirements.

3.4. Design Constraints

Design constraints.

3.4.1. Standards Compliance

Standards compliance.

3.4.2. Hardware Limitations

Hardware limitations.

3.4.3. Other Constraints

Other constraints.

3.5. Software System Attributes

Software system attributes.

3.5.1. Reliability

Reliability.

3.5.2. Availability

Availability.

3.5.3. Security

Security.

3.5.4. Maintainability

Maintainability.

3.5.5. Portability

Portability.
